InfoStart Service

Real Time Information Solution - InfoStart Service

The provision of real time passenger information systems is at the forefront of most Local Authority, Passenger Transport Executive and Transport Operators minds.

This special offer from Connexionz is based on our Real Time Information (RTI) system, which represents a sophisticated solution layered on cellular wireless technology. This highly innovative and proven product can directly address the passenger information requirements of transport users and suppliers, both now and well into the future. Our integrated product suite covers a range of communication types and functionality, suitable for a number of differing situations.

The sheer scale and complexity of implementing an information system means that it can often seem daunting to commit large scale expenditure and resource into a high technology environment where the benefits can often be hard to measure.

Connexionz are offering an easy solution for successfully clearing this first hurdle.

The InfoStart Service

Allows you to deliver a successful, controlled real time passenger information project on time and to budget.

By focussing on the areas that interest you most - starting with a simple, single route design using a specified number of on street displays and vehicles, ConnexionzUK will help you quantify the benefits and work in implementing such a system.

To implement this system Connexionz consultants will:

- In partnership with you adapt the design to reflect your organisation's requirements and agree the InfoStart deliverables.
- Implement the design with specified passenger information displays, either in a station or on the street, and on an agreed number of vehicles including all installation and commissioning.
- Manage the implementation of the central software and provide a complete managed service from our offices, including importing all route, timetable and GPS co-ordinate data.
- Provide the necessary GPRS airtime facility.
- Provide direct consultancy for your performance monitoring and reporting.

Connexionz' consultants will also demonstrate the key features of the system to your customer representatives, and depending on your requirements, this can include users, management, auditors or administrators.

This environment allows you to explore the concepts of RTI and gain valuable hands-on-experience. To help, after the environment has been configured, Connexionz' consultants are available to provide a further 5 days on site assistance. They will offer support, advice and skills transfer before leaving the environment for you to use.

After a pre-determined period, we will return for a further day to discuss with you the benefits of the RTI system and the next steps in providing further assistance with the planning of either partial or complete migration to the RTI system.

Deliverables

Connexionz will:

- Provide an initial consultation with you to determine the areas of strategic focus that maximise your organisations benefits.
- Demonstrate and train your team on the key features of RTI system including optional links to GIS mapping system. (A comprehensive list of features is available upon request).
- Set up the environment based on your specific requirements.
- Fit out 5 vehicles with all necessary equipment including an on board computer, digital data GPRS radio and 15" public service information screens.
- Fit out either 2 Bus Stop displays or a 42" plasma screen for an in station display.
- Provide a PDA for remote monitoring.
- Provide a GPRS airtime facility.
- Review your possible migration paths and issues based on findings from tests and your existing IT and communications environments.

Service Requirements

Hardware: You must provide the depot/station equipment that meets the following requirements. If you wish, we can procure this on your behalf.

- Desktop PC running Windows XP or 2000
- 512 MB RAM
- 4Gb Minimum Free Disk space
- CDROM (bootable)
- Monitor
- Internet connectivity

Site Facilities

An appropriate area with sufficient desks, chairs, ADSL/ internet connections and power outlets to house all test equipment is required. It is preferable if all equipment can be housed in a single room to make using the environment easier.

The cost includes:

- Initial consultations.
- Document design and requirements.
- Configuration of your "host" server and on site workstation.
- Fitting out and commissioning of all On Bus and Bus Stop/Station Equipment.
- A GPRS airtime facility.
- Demonstration software.
- Skills transfer and support.
- Follow up Consultant visit.

Total Cost: £49995 (ex. VAT)
